

# Timer v0.1

May 2007 - present (active)  [android](#), [java](#)

[github](#); [bugs](#); [changes](#)

An Android application to sound alarms at regular intervals, optionally waiting for each alarm to be acknowledged before starting the timer for the next. This is useful for people who need to take tablets N hours apart, for example.

This is not yet considered reliable enough for widespread use, so it's not on Android Market yet. See [github](#) for source/changes.

A previous incarnation of this project existed from May 2007 for PalmOS, but was abandoned when PalmOS itself stopped being supported.
